

HELMI SAYED SULEIMAN

Software Engineer | Backend & AI Systems | @HilmiGas

Istanbul, Turkey • haloomy2002@gmail.com • github.com/HilmiGas • linkedin.com/in/helmi-sayed-suleiman-8134b8242 • hilmigas.github.io

PROFILE

Software Engineering graduate with honors from Istinye University, passionate about building intelligent systems, robust backend architectures, and solving complex problems with clean, efficient code. From an AI-powered attendance system with real-time face recognition to full-stack web applications, I ship things that matter.

TECHNICAL SKILLS

Programming Languages: Python, C#, C++, PHP
Frameworks & Tools: Laravel, REST APIs, Git & GitHub, SQL / Databases
Specializations: Artificial Intelligence, Computer Vision, Backend Architecture, Algorithm Design
Languages: Arabic (Native), English (Academic/Professional)

EDUCATION

B.S. in Software Engineering — Honor Degree — *Istinye University, Istanbul, Turkey* 2022 – 2026

- Graduated with Honors; capstone project recognized for AI innovation.
- Coursework: Software Architecture, Artificial Intelligence, Database Systems, Algorithms & Data Structures, Operating Systems, OOP Design Patterns.

EXPERIENCE

Software Engineering Intern — *scrambleBit, Istanbul, Turkey* 2025 – 2026

- Learned frontend and backend development under senior engineers, gaining hands-on mentorship.
- Learned PHP and Laravel alongside full database systems design.
- Spent roughly 4 months building a strong foundation in core software engineering practices.

Capstone Project — *Istinye University, Istanbul, Turkey* 2025 – 2026

- Led development of an AI-powered smart attendance system using facial recognition (Attendify).
- Integrated a Python + OpenCV computer-vision pipeline for real-time face detection.
- Built a full admin dashboard with a Laravel + PHP backend for reporting and management.
- Delivered the project with a top academic score, recognized for technical excellence.

PROJECTS

Attendify — Next-Gen AI Attendance (Capstone) — *AI Core & Backend Architecture Lead — co-developed with @ibrahemassa and @MoBakour*

- Built an anti-cheat attendance system validating real presence in under 3 seconds via triple-layer verification.
- Used cryptographic time-limited tokens to prevent photo-sharing and replay attacks.
- Implemented GPS geofencing with the Haversine formula for physical presence verification.
- Built biometric AI face-matching with 512-dimensional FaceNet embeddings and pgvector cosine distance, reaching sub-50ms vector search latency via HNSW indexing on PostgreSQL.
- Stack: Go (Gin-Gonic), FastAPI, DeepFace, React 19, TypeScript, React Native (Expo), PostgreSQL, pgvector, HNSW, Laravel, Docker.

FitGas — Gym Companion App — *Full-Stack Frontend Developer*

- Built a standalone gym companion web app with a TDEE calorie calculator and protein/carb/fat macro targets for cut, maintain, and bulk goals.
- Built an interactive workout calendar for logging sets, reps, and weights by date.
- Built a stats and history dashboard tracking total volume, active days, and monthly progress, using client-side JavaScript with persistent LocalStorage.
